## Alarm Outputs

Each alarm can be independently set to one of the following 13 alarm types. The default is 2: *Upper limit*. Auxiliary outputs are allocated for alarms. ON delays and OFF delays (0 to 999 s) can also be specified.

**Note:** For models with heater burnout, SSR failure, and heater overcurrent detection, alarm 1 will be an OR output of the alarm selected from the following alarm types and the alarms for heater burnout, SSR failure, and heater overcurrent. To output only a heater burnout alarm, SSR failure alarm, and heater overcurrent alarm for alarm 1, set the alarm type to 0 (i.e., no alarm function).

Set value	Alarm type	Alarm output operation		Description of function
		When alarm value X is positive	When alarm value X is negative	
0	Alarm function OFF	Output OFF		No alarm

## Electrical Life Expectancy Curve for Relays (Reference Values)

Note: Do not connect a DC load to a Controller with a Long-life Relay Output.

# External Connections

- A voltage output (control output, for driving SSR) is not electrically insulated from the internal circuits. When using a grounding thermocouple, do not connect any of the control output terminals to ground. (If the control output terminals are connected to ground, errors will occur in the measured temperature values as a result of leakage current.)
- Consult with your OMRON representative before using the external power supply for the ES1B for any other purpose.

## E5CN

### Controllers

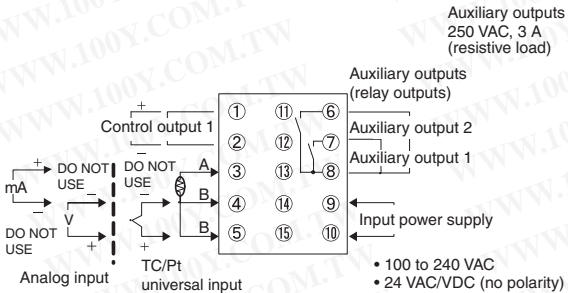

**Control output 1**

- Long-life relay output
- 250 VAC, 3 A (resistive load)
- Relay output
- 250 VAC, 3 A (resistive load)
- Voltage output (for driving SSR)
- 12 VDC, 21 mA
- Current output
- 0 to 20 mA DC
- 4 to 20 mA DC
- Load: 600 Ω max.

The E5□N-□□□□□□ is set for a K-type thermocouple (input type = 5) by default. An input error (5.ERR) will occur if the input type setting does not agree with the temperature sensor. Check the input type.

**Control output 2**

- Voltage output (for driving SSR)
- 12 VDC, 21 mA

A heater burnout alarm, heater short alarm, heater overcurrent alarm, or input alarm is sent to the output to which the alarm 1 function is assigned.

### Option Units

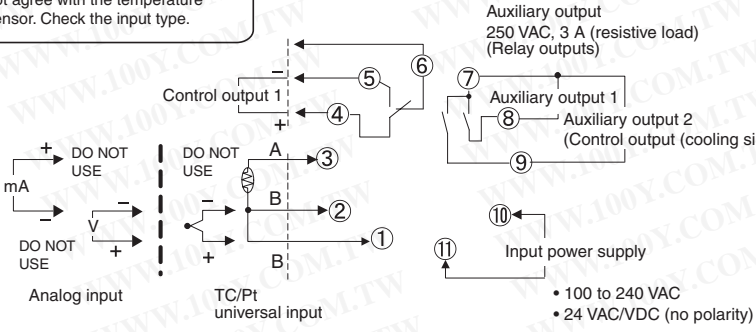

## E5CN-U

The E5□N-□□□□□□ is set for a K-type thermocouple (input type = 5) by default. An input error (5.ERR) will occur if the input type setting does not agree with the temperature sensor. Check the input type.

**Control output 1**

- Relay output (three terminals used)
- SPDT, 250 VAC, 3 A (resistive load)
- Voltage output (for driving SSR)
- 12 VDC, 21 mA
- Current output
- 4 to 20 mA DC
- 0 to 20 mA DC
- Load: 600 W max.

An input error is sent to the output to which the alarm 1 function is assigned.

**Note:** For the Wiring Socket, purchase the P2CF-11 or PG3A-11 separately.

## USB-Serial Conversion Cable E58-CIFQ1

**Terminal Cover**  
E53-COV17

**Note:** The E53-COV10 cannot be used.

**Waterproof Packing**  
Y92S-29 (for DIN 48 × 48)

Order the Waterproof Packing separately if it becomes lost or damaged.  
The Waterproof Packing can be used to achieve an IP66 degree of protection.  
(Deterioration, shrinking, or hardening of the waterproof packing may occur depending on the operating environment. Therefore, periodic replacement is recommended to ensure the level of waterproofing specified in IP66. The time for periodic replacement depends on the operating environment. Be sure to confirm this point at your site. Consider one year a rough standard. OMRON shall not be liable for the level of water resistance if the customer does not perform periodic replacement.)  
The Waterproof Packing does not need to be attached if a waterproof structure is not required.
