

# 1 $\mu$ A Supply Current, 1Mbps, 3.0V to 5.5V, RS-232 Transceivers with AutoShutdown Plus

## General Description

The MAX3224–MAX3227/MAX3244/MAX3245 are 3V-powered EIA/TIA-232 and V.28/V.24 communications interfaces with automatic shutdown/wakeup features and high data-rate capabilities.

All devices achieve a 1 $\mu$ A supply current using Maxim's revolutionary AutoShutdown Plus™ feature. These devices automatically enter a low-power shutdown mode when the RS-232 cable is disconnected or the transmitters of the connected peripherals are inactive, and the UART driving the transmitter inputs is inactive for more than 30 seconds. They turn on again when they sense a valid transition at any transmitter or receiver input. AutoShutdown Plus saves power without changes to the existing BIOS or operating system.

The MAX3225/MAX3227/MAX3245 also feature MegaBaud™ operation, guaranteeing 1Mbps for high-speed applications such as communicating with ISDN modems. The MAX3224/MAX3226/MAX3244 guarantee 250kbps operation. The transceivers have a proprietary low-dropout transmitter output stage enabling true RS-232 performance from a +3.0V to +5.5V supply with a dual charge pump. The charge pump requires only four small 0.1 $\mu$ F capacitors for operation from a 3.3V supply. The MAX3224–MAX3227 feature a logic-level output (READY) that asserts when the charge pump is regulating and the device is ready to begin transmitting.

All devices are available in a space-saving TQFN, TSSOP, and SSOP packages.

## Applications

Notebook, Subnotebook, and Palmtop Computers

Cellular Phones

Battery-Powered Equipment

Handheld Equipment

Peripherals

Printers

## Next Generation Device Features

- ◆ **For Smaller Packaging:**  
MAX3228/MAX3229: +2.5V to +5.5V RS-232 Transceivers in UCSP™
- ◆ **For Low-Voltage or Data Cable Applications:**  
MAX3380E/MAX3381E: +2.35V to +5.5V, 1 $\mu$ A, 2 Tx/2 Rx RS-232 Transceivers with  $\pm$ 15kV ESD-Protected I/O and Logic Pins
- ◆ **For Integrated ESD Protection:**  
MAX3222E/MAX3232E/MAX3237E/MAX3241E<sup>†</sup>/MAX3246E:  $\pm$ 15kV ESD-Protected, Down to 10nA, +3.0V to +5.5V, Up to 1Mbps, True RS-232 Transceivers (MAX3246E Available in UCSP)

## Ordering Information

| PART       | TEMP RANGE     | PIN-PACKAGE                  |
|------------|----------------|------------------------------|
| MAX3224CPP | 0°C to +70°C   | 20 Plastic DIP               |
| MAX3224CAP | 0°C to +70°C   | 20 SSOP                      |
| MAX3224CTP | 0°C to +70°C   | 20 Thin QFN-EP*              |
| MAX3224CUP | 0°C to +70°C   | 20 TSSOP                     |
| MAX3224EPP | -40°C to +85°C | 20 Plastic DIP               |
| MAX3224EAP | -40°C to +85°C | 20 SSOP                      |
| MAX3224ETP | -40°C to +85°C | 20 Thin QFN-EP*<br>5mm x 5mm |
| MAX3224EUP | -40°C to +85°C | 20 TSSOP                     |

Ordering Information continued at end of data sheet.

| 20-Pin TQFN (derate 21.3mW/°C above +70°C)         | 1702.1mW |
| 20-Pin SSOP (derate 8.00mW/°C above +70°C)         | 640mW    |
| 20-Pin TSSOP (derate 7.00mW/°C above +70°C)        | 559mW    |
| 28-Pin Wide SO (derate 12.5mW/°C above +70°C)      | 1W       |
| 28-Pin SSOP (derate 9.52mW/°C above +70°C)         | 762mW    |

Operating Temperature Ranges

|            |                |
|------------|----------------|
| MAX32_ _C_ | 0°C to +70°C   |
| MAX32_ _E_ | -40°C to +85°C |

Storage Temperature Range -65°C to +160°C  
Lead Temperature (soldering, 10s) +300°C

**Note 1:** V<sub>+</sub> and V<sub>-</sub> can have maximum magnitudes of 7V, but their absolute difference cannot exceed 13V.

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

## ELECTRICAL CHARACTERISTICS

(V<sub>CC</sub> = +3V to +5.5V, C<sub>1</sub>–C<sub>4</sub> = 0.1 $\mu$ F, tested at 3.3V  $\pm$ 10%; C<sub>L</sub> = 0.047 $\mu$ F, C<sub>2</sub>–C<sub>4</sub> = 0.33 $\mu$ F, tested at 5.0V  $\pm$ 10%; T<sub>A</sub> = T<sub>MIN</sub> to T<sub>MAX</sub>, unless otherwise noted. Typical values are at T<sub>A</sub> = +25°C.)

| PARAMETER                                                                          | SYMBOL | CONDITIONS                                                                                     | MIN                    | TYP   | MAX                   | UNITS      |

## Detailed Description

### Dual Charge-Pump Voltage Converter

The MAX3224–MAX3227/MAX3244/MAX3245's internal power supply consists of a regulated dual charge pump that provides output voltages of +5.5V (doubling charge pump) and -5.5V (inverting charge pump), over the +3.0V to +5.5V range. The charge pump operates in discontinuous mode: if the output voltages are less

than 5.5V, the charge pump is enabled; if the output voltages exceed 5.5V, the charge-pump is disabled. Each charge pump requires a flying capacitor (C1, C2) and a reservoir capacitor (C3, C4) to generate the V+ and V- supplies.

The READY output (MAX3224–MAX3227) is low when the charge pumps are disabled in shutdown mode. The READY signal asserts high when V- goes below -4V.

MAX3224–MAX3227/MAX3244/MAX3245

# 1 $\mu$ A Supply Current, 1Mbps, 3.0V to 5.5V, RS-232 Transceivers with AutoShutdown Plus

Figure 1. Interface Under Control of PMU

## RS-232 Transmitters

The transmitters are inverting level translators that convert CMOS-logic levels to 5.0V EIA/TIA-232 levels. The MAX3224/MAX3226/MAX3244 guarantee a 250kbps data rate (1Mbps for the MAX3225/MAX3227/MAX3245) with worst-case loads of 3k $\Omega$  in parallel with 1000pF, providing compatibility with PC-to-PC communication software (such as LapLink™). Transmitters can be paralleled to drive multiple receivers. Figure 1 shows a complete system connection.

When  $\overline{\text{FORCEOFF}}$  is driven to ground or when the Auto-Shutdown Plus circuitry senses that all receiver and transmitter inputs are inactive for more than 30sec, the transmitters are disabled and the outputs go into a high-impedance state. When powered off or shut down, the outputs can be driven to  $\pm 12\text{V}$ . The transmitter inputs do not have pull-up resistors. Connect unused inputs to GND or VCC.

LapLink is a trademark of Traveling Software.

Figure 2. The MAX3244/MAX3245 detect RS-232 activity when the UART and interface are shut down.

\*INVALID connected to FORCEON

\*\*INVALID connected to FORCEON and FORCEOFF

## RS-232 Receivers

The receivers convert RS-232 signals to CMOS-logic output levels. The MAX3224–MAX3227 feature inverting outputs that always remain active (Table 1). The MAX3244/MAX3245 have inverting three-state outputs that are high impedance when shut down (FORCEOFF = GND) (Table 1).

The MAX3244/MAX3245 feature an extra, always active, noninverting output, R2OUTB. R2OUTB output monitors receiver activity while the other receivers are high impedance, allowing Ring Indicator applications to be monitored without forward biasing other devices connected to the receiver outputs. This is ideal for systems where VCC is set to ground in shutdown to accommodate peripherals such as UARTs (Figure 2).

AutoShutdown is a trademark of Maxim Integrated Products, Inc.

The MAX3224–MAX3227/MAX3244/MAX3245 feature an INVALID output that is enabled low when no valid RS-232 voltage levels have been detected on all receiver inputs. Because INVALID indicates the receiver input's condition, it is independent of FORCEON and FORCEOFF states (Figures 3 and 4).

## AutoShutdown Plus Mode

The MAX3224–MAX3227/MAX3244/MAX3245 achieve a 1μA supply current with Maxim's AutoShutdown Plus feature, which operates when FORCEOFF is high and a FORCEON is low. When these devices do not sense a valid signal transition on any receiver and transmitter input for 30sec, the on-board charge pumps are shut down, reducing supply current to 1μA. This occurs if the RS-232 cable is disconnected or if the connected

# 1μA Supply Current, 1Mbps, 3.0V to 5.5V, RS-232 Transceivers with AutoShutdown Plus

Figure 3a.  $\overline{\text{INVALID}}$  Functional Diagram,  $\overline{\text{INVALID}}$  Low

Figure 3b.  $\overline{\text{INVALID}}$  Functional Diagram,  $\overline{\text{INVALID}}$  High

Table 2.  $\overline{\text{INVALID}}$  Truth Table

| RS-232 SIGNAL<br>PRESENT AT ANY<br>RECEIVER INPUT | $\overline{\text{INVALID}}$ OUTPUT |
|---------------------------------------------------|------------------------------------|
| Yes                                               | High                               |
| No                                                | Low                                |

peripheral transmitters are turned off, and the UART driving the transmitter inputs is inactive. The system turns on again when a valid transition is applied to any RS-232 receiver or transmitter input. As a result, the system saves power without changes to the existing BIOS or operating system.

Figures 3a and 3b depict valid and invalid RS-232 receiver voltage levels.  $\overline{\text{INVALID}}$  indicates the receiver input's condition, and is independent of  $\text{FORCEON}$  and  $\text{FORCEOFF}$  states. Figure 3 and Tables 1 and 2 summarize the operating modes of the MAX3224-MAX3227/MAX3244/MAX3245 devices.  $\text{FORCEON}$  and  $\text{FORCEOFF}$  override AutoShutdown Plus circuitry. When neither control is asserted, the IC selects

Figure 3c. AutoShutdown Plus Logic

Figure 3d. Power-Down Logic

Figure 4a. Receiver Positive/Negative Thresholds for  $\overline{\text{INVALID}}$

between these states automatically based on the last receiver or transmitter input edge received.

When shut down, the device's charge pumps turn off,  $V_+$  is pulled to  $V_{CC}$ ,  $V_-$  is pulled to ground, the transmitter outputs are high impedance, and  $\text{READY}$  (MAX3224-MAX3227) is driven low. The time required to exit shutdown is typically 100μs (Figure 8).

# 1 $\mu$ A Supply Current, 1Mbps, 3.0V to 5.5V, RS-232 Transceivers with AutoShutdown Plus

Figure 4b. AutoShutdown Plus,  $\overline{\text{INVALID}}$ , and READY Timing Diagram

By connecting FORCEON to  $\overline{\text{INVALID}}$ , the MAX3224–MAX3227/MAX3244/MAX3245 shut down when no valid receiver level and no receiver or transmitter edge is detected for 30sec, and wake up when a valid receiver level or receiver or transmitter edge is detected.

By connecting FORCEON and  $\overline{\text{FORCEOFF}}$  to  $\overline{\text{INVALID}}$ , the MAX3224–MAX3227/MAX3244/MAX3245 shutdown when no valid receiver level is detected and wake up when a valid receiver level is detected (same functionality as AutoShutdown feature on MAX3221/MAX3223/MAX3243).

A mouse or other system with AutoShutdown Plus may need time to wake up. Figure 5 shows a circuit that forces the transmitters on for 100ms, allowing enough time for the other system to realize that the MAX3244/MAX3245 is awake. If the other system outputs valid RS-232 signal transitions within that time, the RS-232 ports on both systems remain enabled.

Figure 5. AutoShutdown Plus Initial Turn-On to Wake Up a Mouse or Another System

MAX3224–MAX3227/MAX3244/MAX3245

# 1 $\mu$ A Supply Current, 1Mbps, 3.0V to 5.5V, RS-232 Transceivers with AutoShutdown Plus

## Software-Controlled Shutdown

If direct software control is desired, use `INVALID` to indicate DTR or Ring Indicator signal. Tie `FORCEOFF` and `FORCEON` together to bypass the AutoShutdown Plus so the line acts like a SHDN input.

## Applications Information

### Capacitor Selection

The capacitor type used for C1–C4 is not critical for proper operation; polarized or nonpolarized capacitors can be used. The charge pump requires 0.1 $\mu$ F capacitors for 3.3V operation. For other supply voltages, see Table 3 for required capacitor values. Do not use values smaller than those listed in Table 3. Increasing the capacitor values (e.g., by a factor of 2) reduces ripple on the transmitter outputs and slightly reduces power consumption. C2, C3, and C4 can be increased without changing C1's value. **However, do not increase C1 without also increasing the values of C2, C3, C4, and CBYPASS, to maintain the proper ratios (C1 to the other capacitors).**

When using the minimum required capacitor values, make sure the capacitor value does not degrade excessively with temperature. If in doubt, use capacitors with a larger nominal value. The capacitor's equivalent series resistance (ESR), which usually rises at low temperatures, influences the amount of ripple on V+ and V-.

### Power-Supply Decoupling

In most circumstances, a 0.1 $\mu$ F VCC bypass capacitor is adequate. In applications that are sensitive to power-supply noise, use a capacitor of the same value as charge-pump capacitor C1. Connect bypass capacitors as close to the IC as possible.

### Transmitter Outputs when Exiting Shutdown

Figure 6 shows two transmitter outputs when exiting shutdown mode. As they become active, the two transmitter outputs are shown going to opposite RS-232 levels (one transmitter input is high; the other is low). Each

**Table 3. Required Minimum Capacitance Values**

| VCC (V)    | C1, CBYPASS ( $\mu$ F) | C2, C3, C4 ( $\mu$ F) |
|------------|------------------------|-----------------------|
| 3.0 to 3.6 | 0.1                    | 0.1                   |
| 4.5 to 5.5 | 0.047                  | 0.33                  |
| 3.0 to 5.5 | 0.22                   | 1                     |

transmitter is loaded with 3k $\Omega$  in parallel with 1000pF. The transmitter outputs display no ringing or undesirable transients as they come out of shutdown. Note that the transmitters are enabled only when the magnitude of V- exceeds approximately -3V.

Figure 6. Transmitter Outputs when Exiting Shutdown or Powering Up

Figure 7. Loopback Test Circuit

# 1 $\mu$ A Supply Current, 1Mbps, 3.0V to 5.5V, RS-232 Transceivers with AutoShutdown Plus

## High Data Rates

The MAX3224/MAX3226/MAX3244 maintain the RS-232  $\pm 5.0V$  minimum transmitter output voltage even at high data rates. Figure 7 shows a transmitter loopback test circuit. Figure 8 shows a loopback test result at 120kbps, and Figure 9 shows the same test at 250kbps. For Figure 8, all transmitters were driven simultaneously at 120kbps into RS-232 loads in parallel with 1000pF. For Figure 9, a single transmitter was driven at 250kbps, and all transmitters were loaded with an RS-232 receiver in parallel with 250pF.

The MAX3225/MAX3227/MAX3245 maintain the RS-232  $\pm 5.0V$  minimum transmitter output voltage at data rates up to 1Mbps (MegaBaud). Figure 10 shows a loopback test result with a single transmitter driven at 1Mbps and all transmitters loaded with an RS-232 receiver in parallel with 250pF.

## Mouse Driveability

The MAX3244/MAX3245 are specifically designed to power serial mice while operating from low-voltage power supplies. They have been tested with leading mouse brands from manufacturers such as Microsoft and Logitech. The MAX3244/MAX3245 successfully

Figure 8. MAX3224/MAX3226/MAX3244 Loopback Test Result at 120kbps

Figure 11b. Mouse Driver Test Circuit

# 1 $\mu$ A Supply Current, 1Mbps, 3.0V to 5.5V, RS-232 Transceivers with AutoShutdown Plus

drove all serial mice tested and met their respective current and voltage requirements. The MAX3244/MAX3245 dual charge pump ensures the transmitters will supply at least  $\pm 5V$  during worst-case conditions. Figure 11a shows the transmitter output voltages under increasing load current. Figure 11b shows a typical mouse connection.

## Interconnection with 3V and 5V Logic

The MAX3224–MAX3227/MAX3244/MAX3245 can directly interface with various 5V logic families, including ACT and HCT CMOS. See Table 4 for more information on possible combinations of interconnections.

Table 5 lists other Maxim 3.0V to 5.5V powered transceivers.

**Table 4. Logic Family Compatibility with Various Supply Voltages**

| SYSTEM POWER-SUPPLY VOLTAGE (V) | V <sub>CC</sub> SUPPLY VOLTAGE (V) | COMPATIBILITY                                                     |
