

DN6849/SE/TE/S

Hall IC (Operating Temperature Range
 $T_{opr} = -40$ to $+100^{\circ}\text{C}$, Operating in Alternative
 Magnetic Field)

Overview

The DN6849/SE/TE/S is a combination of a Hall element, amplifier, Schmitt circuit, and stabilized power supply/temperature compensator integrated on an identical chip by using the IC technology. It amplifies Hall element output at the amplifier, converts into a digital signal through the Schmitt circuit, and drives the TTL or MOS IC directly.

Features

- High sensitivity and low drift
- Stable temperature characteristics due to the additional temperature compensator
- Wide operating supply voltage range ($V_{CC}=4.5$ to 16V)
- Operating in alternative magnetic field
- TTL and MOS ICs directly drivable by output
- Output open collector

Applications

- Speed sensors
- Position sensors
- Rotation sensors
- Keyboard switches
- Microswitches

Note) This IC is not suitable for car electrical equipments.

■ Precaution on Use

1. Change of the operation magnetic flux density does not depend on the supply voltage, because the stabilization power supply is built-in. (only for the range ; $V_{CC} = 4.5$ to $16V$)
2. Change from "H" to "L" level increases the supply current by approx. 1mA.
