DS14C88
QUAD CMOS Line Driver

General Description

The DS14C88, pin-for-pin compatible to the DS1488/MC1488, is a quad line drivers designed to interface data terminal equipment (DTE) with data circuit-terminating equipment (DCE). This device translates standard TTL/CMOS logic levels to levels conforming to EIA-232-D and CCITT V.28 standards.

The device is fabricated in low threshold CMOS metal gate technology. The device provides very low power consumption compared to its bipolar equivalents: 500 µA (DS14C88) versus 25 mA (DS1488).

The DS14C88 simplifies designs by eliminating the need for external slew rate control capacitors. Slew rate control in accordance with EIA-232D is provided on-chip, eliminating the output capacitors.

Features

- Meets EIA-232D and CCITT V.28 standards
- LOW power consumption
- Wide power supply range: ±5V to ±12V

Note 1: "Absolute Maximum Ratings" are those values beyond which the safety of the device cannot be guaranteed. They are not meant to imply that the devices should be operated at these limits. The tables of "Electrical Characteristics" specify conditions for device operation.

Note 2: Derate N Package 12.1 mW/°C, and M Package 8.5 mW/°C above +25°C.

Note 3: I_{OS+} and I_{OS-} values are for one output at a time. If more than one output is shorted simultaneously, the device dissipation may be exceeded.

Note 4: Power supply (V^+, V^-) and GND pins are connected to ground for the Output Resistance Test (R_O).

Note 5: AC input test waveforms for test purposes: $t_r = t_f \leq 20$ ns, $V_{IH} = 2V$, $V_{IL} = 0.8V$ (0.6V at $V^+ = 4.5V$, $V^- = -4.5V$)

Note 6: Input rise and rall times must not exceed 5 µs.

Note 7: The output slew rate, rise time, and fall time are measured from the +3.0V to the −3.0V level on the output waveform.
